

Pasada

"Know when to ride. Know when to leave."

BUSINESS MODEL

Demand-first public transport coordination platform for jeepney cooperatives · Metro Manila
SparkFest 2026 — GDG PUP · SDG 11: Sustainable Cities & Communities · June 2026

The thesis in one line: Pasada is a B2B SaaS platform where the **transport cooperative is the customer**, not the individual driver. Cooperatives enroll their whole fleet — the same way Grab onboards drivers through fleet partners — which solves the adoption problem that kills most transport apps. Passengers and drivers use it free; cooperatives and governments pay for the coordination intelligence.

The adoption flywheel: more passengers broadcast demand → richer real-time demand data → sharper Departure Confidence Score → more value to drivers → more cooperatives enroll fleets → more passengers join. Each turn deepens a proprietary demand dataset competitors cannot copy.

Business Model Canvas

KEY PARTNERS - Transport cooperatives & federations (customer + channel) - LTFRB, DOTr, LGUs, MMDA (regulators, data buyers, endorsers) - Google Cloud — Firebase, Maps, Gemini (infra + startup credits) - Telcos (connectivity; SMS fallback for inclusion) - GDG / PUP civic-tech & academic networks	KEY ACTIVITIES - Real-time demand platform & ML (Confidence Score) - Cooperative onboarding, training & support - Demand-data aggregation & route analytics - Government relations & compliance reporting KEY RESOURCES - Proprietary real-time demand dataset (network-effect moat) - Platform & algorithms (IP) - Cooperative relationships & franchises - Engineering + partnerships team	VALUE PROPOSITIONS Cooperative: dispatch optimization, route analytics, revenue visibility Driver: less idle time, higher revenue, "depart now" confidence Passenger: real-time ETA, no blind waiting — free Government: evidence-based route & compliance data <i>Digitizes street-level demand into smarter dispatch — no booking, no legal friction.</i>	CUSTOMER RELATIONSHIPS - Co-op: dedicated onboarding + customer success; annual contract / SLA - Drivers & passengers: self-serve apps, in-app support - Government: account-managed data partnership CHANNELS - Direct B2B field sales to co-ops & federations - Top-down LTFRB / DOTr / LGU endorsement - App stores (passenger & driver apps) - Civic-tech / university networks	CUSTOMER SEGMENTS Primary buyer: PUV transport cooperatives (B2B) Two-sided users: drivers & passengers Secondary buyer: LGUs / LTFRB / MMDA (data)
COST STRUCTURE Google Maps Platform API — routing/ETA calls: the largest variable cost; controlled via caching, batching & server-side ETA - Cloud infra: Firestore, Cloud Run, Cloud Messaging - Gemini API inference (decision support) - Team: engineering, product, partnerships & customer success - Field sales & onboarding; G&A <i>Marginal cost per new cooperative is low → SaaS-grade gross margins once Maps usage is optimized</i>		REVENUE STREAMS Per-active-unit SaaS subscription (core, recurring) - Tiered cooperative plans by fleet size - Government data & analytics licensing (annual) - Premium analytics / forecasting add-on (upsell) - Free passenger app — never monetized; fuels the data flywheel <i>Future:</i> fare/boundary digitization (fintech), stop sponsorship		

Revenue Model & Pricing

Pricing is **value-aligned and asset-light**: Pasada charges per active unit so price scales with the fleet it makes more productive, while passengers stay free to maximize the demand data that powers every other feature.

Plan	For	Price	Includes
Pilot (land)	New co-op, 1–2 routes, 90 days	Free	Full driver + dispatch dashboard, hands-on onboarding
Starter	Small co-ops (≤ 25 units)	₱2,500 / month flat	Heatmap, Departure Confidence Score, core KPIs
Standard	26–100 units	₱199 / active unit / month	+ Full analytics, dispatch recommendations, support
Fleet	100+ units / federations	₱149 / unit / month (volume)	+ Premium analytics, API access, priority SLA
Gov Data License	LGU / LTFRB / MMDA	₱300k–₱1M / year	Anonymized route-efficiency & compliance dashboards
Premium add-on	Any cooperative	+₱50 / unit / month	Demand forecasting, historical trends, anomaly alerts

Market Opportunity

The PUV Modernization Program has already restructured the market into the exact B2B buyers Pasada targets: as of 2024, **1,728 transport cooperatives and corporations** (262,344 members) now hold the franchises, with roughly **78% of jeepneys consolidated**. The customer is consolidated, identifiable, and regulator-mandated to operate as an organized fleet.

~200,000

jeepney units nationwide
(~42,000 in Metro Manila)

~9 million

jeepney passenger trips per day
(~40% of motorized person-trips)

1,728

PUV cooperatives & corporations — the B2B customer base

83.8%

internet penetration (97.5M users); near-universal mobile

TAM · SAM · SOM

Layer	Definition	Annual value
TAM	All ~200,000 PUVs nationwide on a blended SaaS subscription	~ ₱432M / yr ($\approx$ US\$7–8M) + government data licensing upside
SAM	Consolidated jeepney cooperatives in Metro Manila (~42,000 units)	~ ₱91M / yr
SOM (Yr 1–2)	15–25 NCR cooperatives converted from pilot (~2,500 units)	~ ₱5.4M / yr ARR + 1–2 LGU data pilots

Assumptions: blended ARPU ₱180 / active unit / month (between Standard and Fleet tiers). Government licensing treated as additive upside, not counted in the figures above (conservative). Figures are estimates for a pre-revenue MVP.

Unit Economics

Worked example for a typical mid-size cooperative of **50 active units** on the Standard plan (₱199/unit/month):

Metric	Value	Basis
--------	-------	-------

Revenue per cooperative	₱119,400 / yr	50 units × ₱199 × 12
Value created for the co-op	~₱195,000 / mo	~₱150/day/unit uplift (one extra near-full trip) × 26 days × 50 units
Price as share of value	~5%	₱9,950 charged vs ~₱195k value → ~20× value-to-price
Gross margin	~85%	Variable cost-to-serve ~₱30/unit/mo (cloud + Maps + Gemini, optimized)
CAC	~₱20k–₱40k	Relationship-led field sale + onboarding per cooperative
Payback / LTV:CAC	< 6 months / ~9x+	3-yr LTV ~₱358k; low churn from fleet-level lock-in

Illustrative estimates. The economics hold because Pasada captures a small fraction of the revenue it unlocks, and because fleet enrollment makes churn structurally low.

Go-to-Market

Phase	Window	Focus
1. Prove	0–3 mo	One anchor cooperative, 1–2 Metro Manila routes. Measure wait-time down and revenue-per-unit up. (Hackathon MVP becomes the pilot.)
2. Land & expand	3–12 mo	Convert the pilot; expand across NCR consolidated co-ops; secure one LTFRB/LGU endorsement. Target 15–25 cooperatives.
3. Scale	12–24 mo	Enter Cebu & Davao; launch government data licensing; close federation-level deals.
4. Platform	24 mo+	Extend to UV Express & buses; add fare/boundary digitization (fintech) and stop sponsorship.

Why It Is Defensible

- **Data network effect.** The real-time demand dataset compounds with every passenger broadcast and is the input to every premium feature — a moat that grows with usage and cannot be bought.
- **B2B fleet lock-in.** Cooperatives enroll entire fleets on annual contracts; switching means re-training every driver, so churn is structurally low.
- **Regulatory alignment.** By supplying compliance and route-efficiency data, Pasada is a partner to LTFRB/LGUs rather than a disruptor — the opposite of the regulatory friction ride-hailing faced.
- **Asset-light.** No vehicles, no payments, no guaranteed pickups → capital-efficient, fast to scale, and free of ride-hailing's legal exposure.

Impact & SDG Alignment

The business model and the social mission point the same direction: revenue grows by making public transport more efficient and inclusive.

SDG	How Pasada delivers
11 — Sustainable Cities (primary)	11.2 cuts wait time and improves PUV efficiency; 11.b gives co-ops and LGUs data for evidence-based transport policy
	A digital infrastructure layer over an existing analog transport system

9 — Industry & Infrastructure

8 — Decent Work	Less idle time and smarter dispatch raise driver take-home income
13 — Climate Action	Better load factors and less terminal idling reduce emissions per passenger-trip

Social inclusion: a simple stop kiosk or SMS fallback lets commuters without data plans still broadcast demand — keeping the platform open to all income levels, not just smartphone users.

Market sources: LTFRB / DOTr consolidation data (2024); Inquirer, Rappler, Manila Bulletin; Statista & Changing-Transport (ridership); DataReportal Digital 2025 Philippines. Figures are estimates compiled for SparkFest 2026.
